

Arrays!

(and drop down boxes!)

Another HTML Thing

- ▶ `<select>`
- ▶ Creates a dropdown box on the webpage
 - ▶ Allows the user to select from several choices
- ▶ The advantage of using `select` is that we are guaranteed that the input will be one of our choices (no invalid user input)
- ▶ To specify options in a dropdown box we use the `<option>` tag inside the `<select>` tag

Creating a Dropdown Menu!

<select>

Please select your drink size from the menu below:

Grande ▾	Make My Drink
Short	
Tall	
Grande	
Venti	
Trenta	

```
<h1>Creating a Dropdown Menu!</h1>
```

```
<p>Please select your drink size from the menu below: </p>
```

```
<select id="drinkSize">
```

```
  <option value="short">Short</option>
```

```
  <option value="tall">Tall</option>
```

```
  <option value="grande">Grande</option>
```

```
  <option value="venti">Venti</option>
```

```
  <option value="trenta">Trenta</option>
```

```
</select>
```

```
<button type="button" onclick="makeDrink()">Make My  
Drink</button>
```

▶ We must set the value attribute of the option, so we can access the value contained in it using JavaScript

<select>

- ▶ How do you think we access the currently selected option in the JavaScript?

Creating a Dropdown Menu!

Please select your drink size from the menu below:

Venti ▼

This page says:

Here's your venti

☐ Prevent this page from creating additional dialogs.

OK

```
function makeDrink() {  
    var size =  
document.getElementById("drinkSize");  
    alert("Here's your " + size.value);  
}
```

Remember

▶ Values

- ▶ Have type
- ▶ Represent a concrete number, string, or boolean
- ▶ Ex. 1, “cow”, true

▶ Variables

- ▶ Hold values in memory
- ▶ Can change their values
- ▶ Are used to carry information through our programs

Arrays Make Life Easier

- ▶ Have you ever thought “Man, I have so much information to store, I don’t want to have to create a million variables to store it all!”
- ▶ If you have thought this, you’re going to love arrays
- ▶ Arrays are an ordered set of elements
- ▶ Arrays are used to store and number a list of things
 - ▶ We start numbering these items at 0
 - ▶ This number is called the index

Creating Arrays

- ▶ Concept:
- ▶ We store an array in a variable
- ▶ Each item in the array is a value and has an index number
- ▶ We can then refer to an item in the array using its array name and index number

Method 1 to Create Arrays

► Using []

```
var myArray = [ ];
```

Creates an empty array

myArray → []

Method 1 to Create Arrays

► Using []

```
var myArray = [ ];
```

```
var myArray2 = [5];
```

Creates an array of size 1
That contains the number 5

myArray2 →

5

index 0

Method 1 to Create Arrays

► Using []

```
var myArray = [];
```

```
var myArray2 = [5];
```

```
var myArray3 = ["apple", "orange", "banana"];
```

Creates an array of size 3, containing 3 strings

Method 1 to Create Arrays

► Using []

```
var myArray = [];
```

```
var myArray2 = [5];
```

```
var myArray3 = ["apple", "orange", "banana"];
```

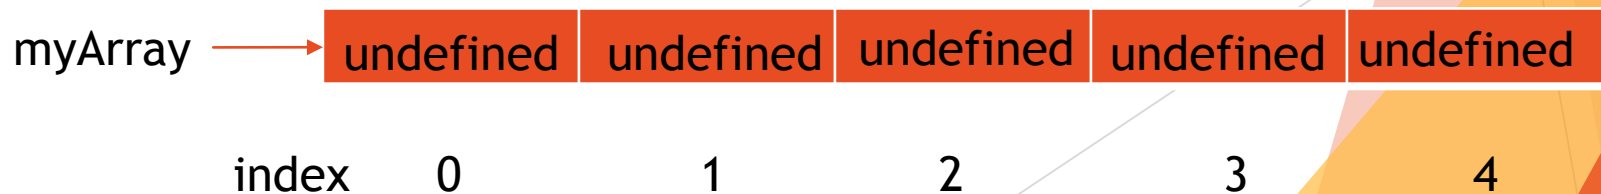

Method 2 to Create Arrays

- ▶ **Array()** function

```
var myArray = new Array(5);
```

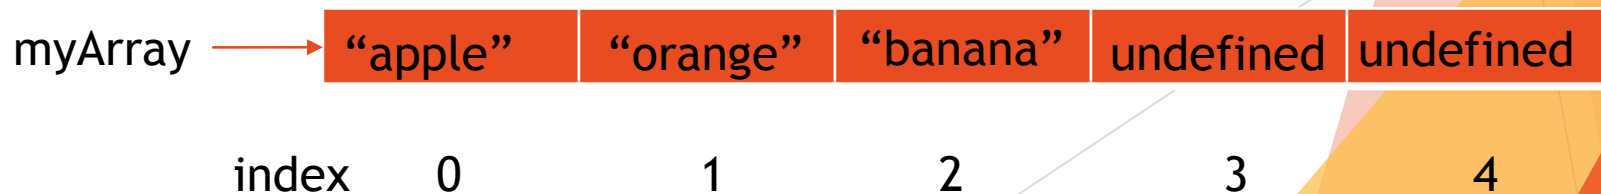

- ▶ Creates an array of length 5, with the value “undefined” stored in each space

Method 2 to Create Arrays

- ▶ Then we can fill each space the array directly

```
myArray[0] = "apple";  
myArray[1] = "orange";  
myArray[2] = "banana";
```

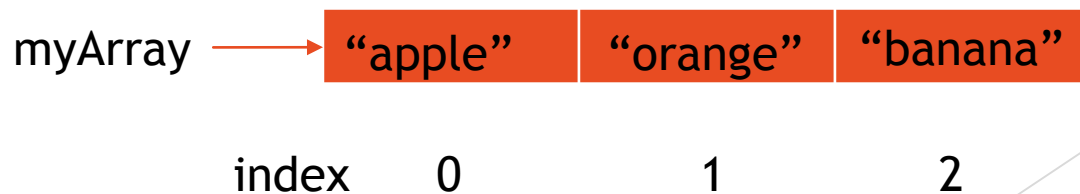

Accessing Array Items

- ▶ We can store items in the array and get items from the array
- ▶ We need two pieces of information to do this
 - ▶ Array name and index the item is stored at

`console.log(myArray[0])` prints “apple”

`console.log(myArray[1])` prints “orange”

`console.log(myArray[2])` prints “banana”

Modifying Array Items

- ▶ We still need the same two pieces of information to do this

```
myArray[0] = "grape";
```

```
myArray[2] = "peach";
```

Adding Items to an Array

- ▶ Arrays in JavaScript can change size (this is not true in other languages)
- ▶ So we can add new elements to our arrays
- ▶ The function that allows us to do this is `.push(item)`

```
var myArray3 = ["apple", "orange",  
"banana"];  
myArray3.push("pear");
```

Removing Items From an Array

- ▶ We can also remove items from **the end of** an array
- ▶ The function that allows us to do this is `pop()`
 - ▶ `pop()` will remove the LAST item from the array

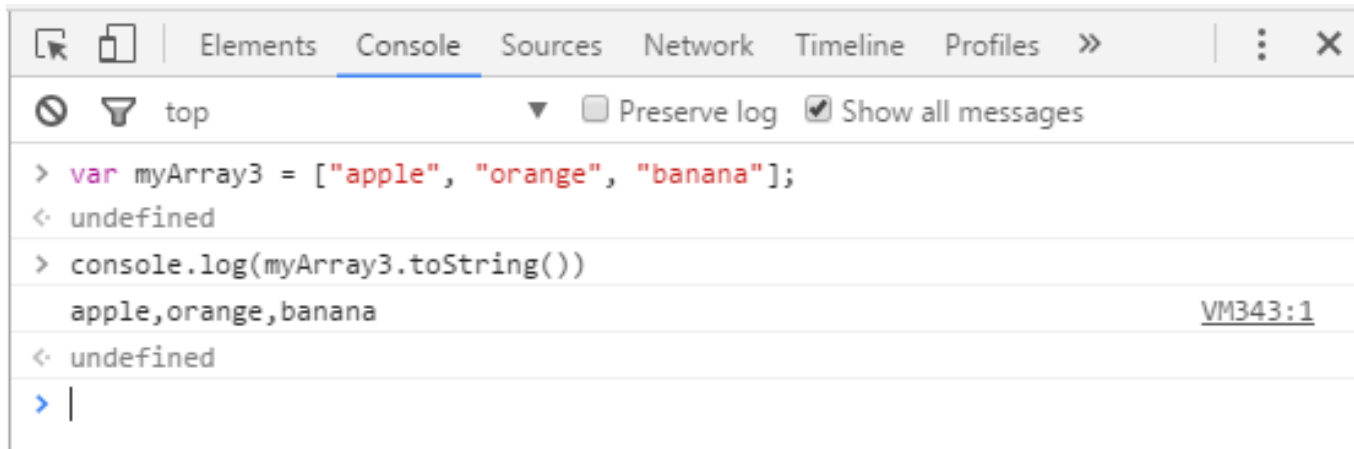

```
var item = myArray.pop();
```

Printing Arrays

- ▶ You can print the contents of an entire array to the console using
- ▶ `console.log(array.toString());`

A screenshot of a web browser's developer console. The console is open, showing the 'Console' tab. The top bar has icons for 'Elements', 'Console', 'Sources', 'Network', 'Timeline', and 'Profiles'. Below the bar, there are filters for 'top' and 'Preserve log' (unchecked) and 'Show all messages' (checked). The console log shows the following sequence of events:

- A JavaScript command: `> var myArray3 = ["apple", "orange", "banana"];`
- The result of the command: `< undefined`
- A JavaScript command: `> console.log(myArray3.toString());`
- The output of the command: `apple,orange,banana` (with a link to `VM343:1` on the right)
- The result of the command: `< undefined`
- A prompt character: `> |`

Exercise

- ▶ Write the JavaScript to create an array to store the names of 25 students (but do not fill the array)
- ▶ Write the JavaScript to create an array to store a credit card transaction. This array should store the following information:
 - ▶ The name on the card: “Dr. Pepper”
 - ▶ The credit card number “1111222233334444”
 - ▶ The security number 555
 - ▶ The balance of the credit card, which is 3000

Did You Notice?

- ▶ Did you notice that the array index starts at 0 and counts the number of items stored in the array?
- ▶ Did that make you think “Hey, I could probably use a for loop with arrays!”
- ▶ If you thought this, you’re right, and you’re thinking like a computer scientist.

Example

- ▶ Let's create an array of size 5 and fill it with zeroes

```
var zeroArray = new Array(5);  
for(var i = 0; i < zeroArray.length; i++) {  
    zeroArray[i] = 0;  
}
```

- ▶ What do you think zeroArray.length returns?
- ▶ Why did we use < and not <= ?

For Loops and Arrays

- ▶ Because we can access each element of an array via an index, it makes sense that we can then process arrays with loops
- ▶ Ex. Let's try to double the value of each element stored in an array

```
var someNums = [5,10,20,30];  
for(var j = 0; j < someNums.length; j++){  
    someNums[j] = someNums[j] * 2;  
}
```

- ▶ Can you think of another way we could have written this?

Copying Arrays

- ▶ We can use the `slice()` method to create copies of arrays
- ▶ `slice()` method returns the selected elements in an array, as a new array object
- ▶ `slice()` method selects the elements starting at the given *start* argument, and ends at, *but does not include*, the given *end* argument
- ▶ If we don't specify any parameters the whole array is copied

```
var fruits =  
["Banana", "Orange", "Lemon", "Apple", "Mango"];  
var citrus = fruits.slice(1, 3);  
var variety = fruits.slice();
```

Finding Values in Arrays

- ▶ The `indexOf(someValue)` method searches through the array and looks to see if `someValue` is stored in the array
- ▶ If `someValue` is in the array, the method returns the first index the value is located at
- ▶ If `someValue` is not in the array, the method will return `-1`

```
var fruits =  
["Banana", "Orange", "Lemon", "Apple", "Lemon"];  
console.log(fruits.indexOf("Lemon"));  
console.log(fruits.indexOf("Potato"));
```

Exercise

- ▶ What is the index of Big White in the following array?

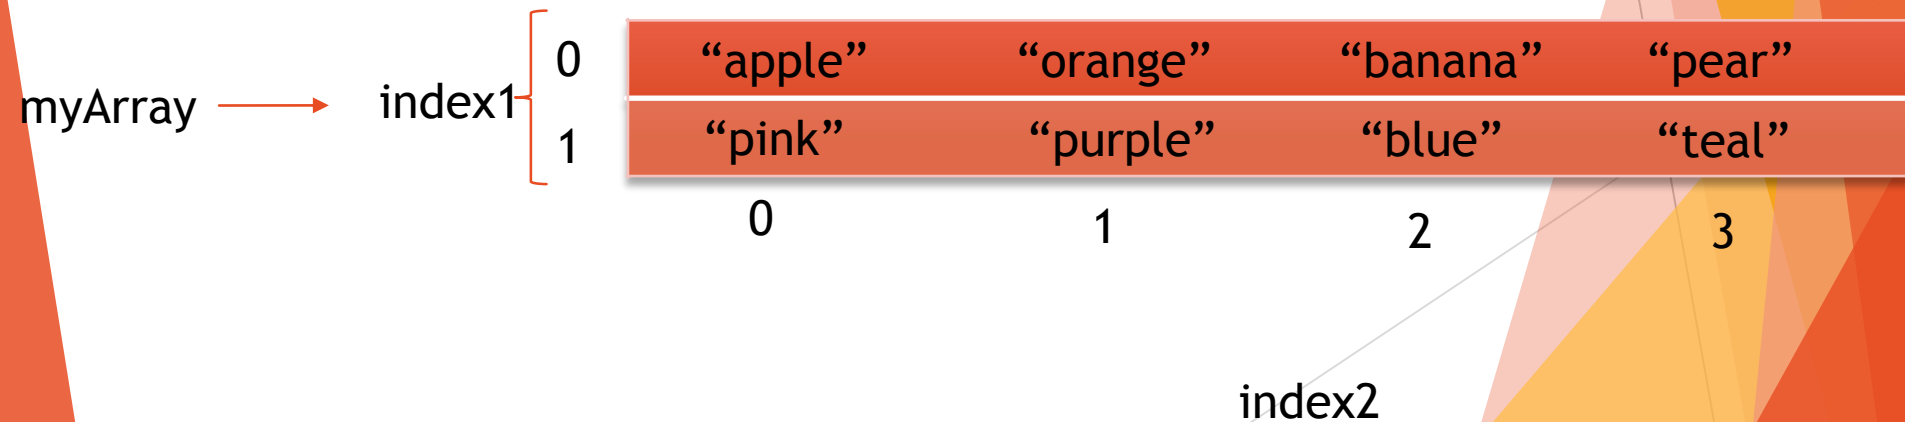

```
var resorts = ["Whistler", "Silverstar",  
              "Big White", "Revelstoke",  
              "Sun Peaks", "Red Mntn"];
```

- ▶ Write an expression that refers to the string Revelstoke within the array.
- ▶ What is the value of the expression skiResorts.length?
- ▶ What is the index of the last item in the array?
- ▶ What is the value of the expression skiResorts[5]?
- ▶ Write an expression to find the first index of "Silverstar" within the array

2D Arrays

- ▶ 2D arrays are just arrays that store arrays
- ▶ They are handy for representing grids or tables of information in our programs

```
var myArray = Array(2);  
myArray[0] = ["apple", "orange", "banana", "pear"];  
myArray[1] = ["pink", "purple", "blue", "teal"];
```

2D Arrays

- ▶ `myArray[1]` is the array `["pink", "purple", "blue", "teal"]`
- ▶ `myArray[0][0]` is apple
- ▶ `myArray[1][1]` is purple

myArray → index1	0	"apple"	"orange"	"banana"	"pear"
	1	"pink"	"purple"	"blue"	"teal"
		0	1	2	3
		index2			

Question

- ▶ What is stored at `myArray[0][3]`?
- ▶ What is stored at `myArray[1][2]`?

myArray → index1

0	"apple"	"orange"	"banana"	"pear"
1	"pink"	"purple"	"blue"	"teal"
	0	1	2	3

index2

Exercise

- ▶ Write the JavaScript to create a 2D array. This array should store the following names and midterm exam grades for each of the following students:
 - ▶ Jamie 100
 - ▶ Amir 75
 - ▶ Joel 75
 - ▶ Hillary 50
 - ▶ Donald 25
- ▶ Now, use a for loop to calculate the average of the midterm exam grades stored in the array

Adding Items to Arrays

- ▶ `splice(position, numberOfItemsToRemove, itemToAdd);`
- ▶ Parameters: start position, number of elements to delete, elements to add

```
var array = ["one", "two", "four"];  
array.splice(2, 0, "three");  
array would contain ["one", "two", "three",  
"four"]
```

- ▶ The `splice` method returns an empty array when no elements are removed; otherwise it returns an array containing the removed element

```
var ar = [1, 2, 3, 4, 5, 6];  
ar.splice(3, 0, "a", "b", "c");  
console.log( ar );  
//prints [1, 2, 3, "a", "b", "c", 4, 5, 6]
```

Putting Arrays Together

- ▶ the `concat()` method will join two or more arrays together
- ▶ This method doesn't change the existing array, it returns a new array containing the values of all joined arrays

```
var heros = ["Batman", "Robin"];  
var villains = ["Joker",  
"Penguin", "Riddler"];  
var characters =  
heros.concat(villains);
```

Exercise

- ▶ Given the following array

```
var arr = ["dog", "cat", "bird"];
```

What is the value of result:

```
var result = arr[0] = arr[2];
```

- ▶ Write a function called `oddArray(N)` that accepts the size of an array as input. This function should then return an array filled with the first `N` odd numbers.
